# Tanznt

An AI-powered talent operating system that builds, improves, and deploys talent — powered by a persistent memory layer that compounds over time.

THE PROBLEM

# Hiring is a network with no memory.

- Candidates restart every application from scratch
- Companies lose context across roles and tools
- Evaluation signals don't carry forward
- Recruiters spend 80% of their time on mechanical work instead of judgment calls

The result: wasted effort, poor matching, and zero compounding intelligence.

THE CORE INSIGHT

# Talent is not static — it evolves over time.

EXISTING SYSTEMS SEE

- A resume
- A score
- A pipeline stage

REALITY IS

- Skills that grow
- Preferences that shift
- History that compounds

PART I — BUSINESS CASE

# An AI-powered talent operating system for RPO companies

It doesn't just track candidates — it profiles them, scores them, matches them, coaches them, interviews them, assesses them, and learns from every interaction to make the next hire faster and better.

POSITIONING

# RPO, not SaaS.

## Software is our infrastructure.
## Outcomes are our product.

- **Managed hiring (RPO)** — we deliver hires, not dashboards
- **Role fulfillment** — pay-per-outcome aligned with client success
- **Talent development** — college pipelines, training cohorts, internship-to-hire funnels

COMPETITIVE ADVANTAGE

# Why this wins

| ADVANTAGE | WHAT IT MEANS |
| --- | --- |
| Compounding data | Every candidate interaction improves future matching — the system gets smarter with scale |
| Supply control | College partnerships and talent development create candidates, not just find them |
| Evidence chains | Explainable AI decisions with scores, alignment, and gaps build trust with hiring managers |
| Persistent memory | Candidates carry forward across roles and time — nothing is lost |
| Outcome alignment | RPO model means we eat our own cooking — bad matches hurt us, not just the client |

MOATS

# The defensibility

1. **The memory layer** — persistent candidate intelligence that compounds across roles, clients, and time
2. **The talent graph** — 26 specialized AI agents building interconnected intelligence, not a single LLM bolted onto a database
3. **The supply pipeline** — college and institutional partnerships that create pre-qualified talent before it hits the open market
4. **The evidence hierarchy** — observed behavior › tested scores › AI-scored profiles › self-reported claims. Every recommendation has a chain of evidence
5. **The outcome model** — SaaS vendors optimize for seats sold. We optimize for hires made. Different incentives, fundamentally different product

THE SHIFT

# The transformation

| FROM | | TO |
| --- | --- | --- |
| ~~Applications~~ | → | Relationships |
| ~~Resumes~~ | → | Living profiles |
| ~~One-time hiring~~ | → | Continuous talent engagement |
| ~~Static pipelines~~ | → | Learning systems |
| ~~Black-box scores~~ | → | Evidence-backed decisions |
| ~~Software licenses~~ | → | Hiring outcomes |

ROADMAP

# The autonomy levels

| LEVEL | DESCRIPTION | STATUS |
| --- | --- | --- |
| L2 | AI collaborates with recruiters — surfaces matches, drafts outreach, synthesizes feedback | Now |
| L3 | AI executes workflows autonomously with recruiter oversight at decision points | Next |
| L4 | AI manages end-to-end pipelines, escalating only exceptions | Future |
| L5 | Fully autonomous hiring systems at scale | Vision |

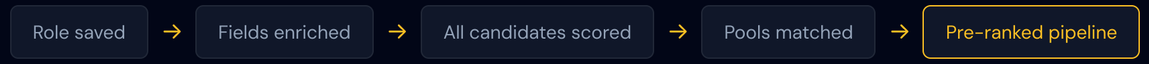

Architected for L5 from day one — every agent, rule, and intelligence layer is designed to operate without human intervention when the trust threshold is met.

PART II — THE PRODUCT · ACT 1

# Define the need

A recruiter pastes a JD or describes the role in plain language. The Role Wizard agent extracts structured fields — competencies, must-haves, compensation range, team context.

The moment the role is saved:

The recruiter opens a pre-ranked pipeline — before sourcing a single candidate.

ACT 2

# Build the supply

### Entry channels

- **Resume upload** — parsed and scored automatically
- **Portal** — candidates maintain living profiles
- **Talent pools** — dynamic, auto-populating segments
- **College pipelines** — pre-qualified cohorts

The candidate isn't a resume in a drawer — they're a living entity whose signals compound.

### On every new candidate

1. Extract structured profile
2. Score talent across pillars
3. Match against every open role
4. Assign to matching pools
5. Index for semantic search

ACT 3

# Engage & attract

DRAFTING

### AI-personalized

Messages tailored to candidate profile + role context + prior interaction history

CHANNELS

### Multi-channel

Email, LinkedIn, SMS — with response tracking (opened, clicked, replied)

INTELLIGENCE

### Timing & re-engagement

Optimal send windows. Silver medalist campaigns for prior-round candidates

Every interaction is tracked. Engagement history persists across roles.

ACT 4

# Screen & assess

| TYPE | ANALYZER | OUTPUT |
| --- | --- | --- |
| Technical | Subjective rubric (0-5) | Criterion scores + evidence |
| Aptitude | MCQ exact match | Score + breakdown |
| Coding | Code evaluator | Correctness, quality, efficiency |
| Case Study | Rubric-based | Strategic thinking scores |
| Personality | Trait extraction | Behavioral profile |

Candidates take assessments through the portal — single-question-per-screen, auto-save, timed. Mock interviews with AI coaching help candidates prepare.

ACT 5

# Interview — the evidence room

**BEFORE**

### AI-generated prep plan

Evidence targets per competency, suggested questions, candidate-specific talking points

**DURING**

### Live interview room

Video grid · live recording · real-time transcription · panelist scorecards · live assessments · proctoring

**AFTER**

### Evidence synthesis

Transcript analysis (engagement, depth, communication) · scorecard alignment · red flags · standout moments · panel agreement

A unified evaluation with evidence chains — not gut feelings.

ACT 6

# Intelligence synthesis

## Five intelligence layers

| | |
|---|---|
| Candidate | Talent score, skill gaps, growth trajectory |
| Interview | Evaluation scores, themes, red flags |
| Assessment | Rubric scores, breakdown, insights |
| Application | Stage progression, decision reasoning |
| Match | Fit score, alignment with sources, gaps |

## Evidence hierarchy

Contradictions are flagged with evidence from both sides.

ACT 7

# Decide — the match

SCORE

**Fit Score (0–100)**

With evidence chains from every source

ALIGNMENT

**Per-competency**

Criterion scores with source attribution

SIGNAL

**Strong / Moderate / Weak**

Clear recommendation with confidence

GAPS

**What's missing**

Backed by evidence, not hunches

NARRATIVE

**Hiring summary**

Ready for stakeholder conversations

Decision readiness is computed automatically — the system signals when enough evidence exists.

ACT 8

# Close — the offer

GENERATION

### Offer package

Compensation snapshot: salary, bonus, equity, benefits. Checklist tracking for onboarding steps.

INTELLIGENCE

### Close risk analysis

Likelihood of acceptance, deal-breakers, timing risks, counter-offer strategy recommendations.

ACCEPTED

### Cascade forward

Candidate hired. Competing applications auto-rejected. Role fulfillment tracked.

DECLINED

### Cascade back

Pipeline cascades. Candidate returns to talent pools for future roles. Nothing is lost.

ACT 9

# The compounding loop

## This is where Tanznt diverges from every ATS.

### The system learns

- Talent pools auto-refresh as new candidates match
- Role health analysis tracks pipeline velocity
- Recruiter briefings surface daily triage
- Cross-role learning improves matching accuracy

### The candidate grows

- Mock interviews and coaching improve readiness
- Portfolio-native profiles replace static resumes
- Skills evolution is tracked, not just captured once
- Assessment scores and feedback carry forward

A "maybe" for Role A is already scored, profiled, and intelligence-enriched when Role B opens.

PART III — ARCHITECTURE

# The four engines

**INTELLIGENCE ENGINE**

26 specialized AI agents + persistent memory layer

**SUPPLY**

- Candidates
- Pools
- Engagement
- Portal

**DEMAND**

- Roles
- Applications
- Pipeline
- Scheduling

**EVALUATION**

- Interviews
- Assessments
- Scorecards
- Coaching

**DECISION**

- Matches
- Offers
- Triage
- Briefings

THE BRAIN

# 26 specialized agents

| FAMILY | AGENTS | PURPOSE |
| --- | --- | --- |
| Candidate | Profile extractor, talent scorer, comparer, interview coach | Understand and develop talent |
| Role | Wizard, field enricher, health analyzer, status reporter | Structure and monitor requisitions |
| Matching | Role-candidate matcher, pool matcher, pool insight analyzer | Connect supply to demand with evidence |
| Interview | Prep planner, transcript analyzer, scorecard analyzer | Extract structured signal from conversations |
| Assessment | Evaluator, code evaluator, personality analyzer | Grade and score with rubrics |
| Offer | Close analyst, letter generator, letter extractor | Manage the close with risk intelligence |
| Engagement | Drafter, briefing generator | Personalize outreach, surface priorities |
| General | Ask assistant, NL query engine | Ad-hoc questions across all data |

Every agent produces structured, validated output — not free-form text.

THE NERVOUS SYSTEM

# The memory layer

**CANDIDATE**

Talent score, skill profile, growth trajectory, gaps

**INTERVIEW**

Prep targets, evaluation scores, themes, red flags, standout moments

**ASSESSMENT**

Rubric scores, breakdown by criterion, evaluator insights

**APPLICATION**

Stage progression, decision reasoning, evidence accumulation

**ENGAGEMENT**

Response rates, optimal timing, channel effectiveness

**MATCH**

Fit score, criterion alignment with source attribution, gaps

Intelligence persists across roles. A candidate interviewed for Role A carries their evaluation into Role B.

THE REFLEXES

# Event-driven automation

| TRIGGER | WHAT HAPPENS AUTOMATICALLY |
| --- | --- |
| New candidate | Parse resume → extract profile → score talent → match all roles → assign to pools |
| New role | Enrich fields → match all candidates → identify matching pools |
| Interview done | Synthesize transcript + scorecards → evaluate alignment → update match scores |
| Assessment submitted | Route to analyzer → grade → write intelligence → check decision readiness |
| Offer accepted | Update candidate status → reject competing applications → track fulfillment |

The recruiter takes an action, and by the time they navigate to the next page, the system has already processed everything. No waiting. No manual steps.

THE RECALL

# Three ways to find talent

BROWSE

### Paginated listing

Sorted by recency or score. For daily triage and pipeline review.

KEYWORD

### Full-text search

Stemming and prefix matching across resumes, descriptions, notes, and transcripts.

SEMANTIC

### Natural language

"Someone who can lead a distributed infrastructure team and has scaled systems to 10M+ users"

Recruiters ask questions in plain English. No boolean operators, no query syntax, no training.

THE RELATIONSHIP + THE VOICE

# Candidate portal & engagement

### Portal

- **Living profiles** that evolve across roles and time
- **Assessment portal** with auto-save and progress tracking
- **Interview prep** — AI coaching with readiness scoring
- **Mock interviews** with actionable improvement feedback
- **Feedback visibility** — candidates see where they stand

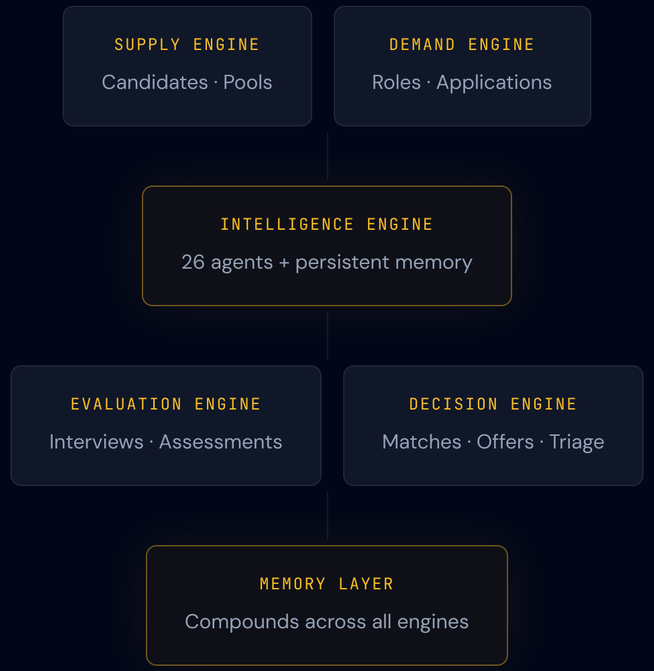

Every portal interaction feeds back into the intelligence layer. The system knows when a candidate improves.

### Engagement

- **AI drafting** — personalized per candidate + role + history
- **Multi-channel** — email, LinkedIn, SMS
- **Response tracking** — opened, clicked, replied
- **Send timing** — optimal windows from pattern intelligence
- **Re-engagement** — silver medalist campaigns for new roles

SYSTEM VIEW

# How it connects

Every engine feeds the memory layer. The memory layer informs every engine.

# Tanznt

We don't sell software — we deliver hires, powered by a system that gets smarter with every one.

Software is infrastructure. Outcomes are our product.
